

# CROC

Crocodiles vary from American Alligators in a number of ways. Crocodiles are larger animals. Alligators have broader “U” shaped jaws whilst crocs have more “V” shaped jaws.

As a result of its jaw shape the alligator's teeth are almost completely hidden when the jaws are closed. With crocs the teeth are usually exposed

Crocs can survive in saltwater, using their salivary glands to excrete excess salt. Alligators don't have this ability and so are restricted to freshwater habitats but can survive longer in cold water.
