

# WHERE FROM ?

The first ancestors of the crocodile appeared 250 million years ago with many of the features that make the croc such a successful stealth hunter already in place; streamlined body, long tail, protective armour and long, powerful jaws.

These animals included species over 10m in length. Some 65 million years ago a massive extinction occurred killing off all but a few species of crocodiles. The descendants of these animals are the 23 species of crocodiles that are found on earth today.
