

Sheet WEB spider

Cambridgea species

A forest species that can be found in parks & larger gardens.

This spider spreads it's web across such places as tree branches or under the eaves of old buildings.

The sheet web spider places itself under the web and grabs the unfortunate prey that fall onto the top of the web, it has very large fangs to help with this.

Up to 20mm.

ORB-weaver spiders spin HUGE webs that STRETCH more than 18 feet across
